1 Introduction

1.1 Contributing

These study materials are heavily based on [professor Goik's "Software Defined Infrastructure" lecture at HdM Stuttgart](#).

Found an error or have a suggestion? Please open an issue on GitHub (github.com/pojntfx/uni-sdi-notes):

2 Hosts

Add the following A and AAAA records to a public DNS server (with root domain alphahorizon.io):

felixs-sdi1	10800	IN	A	138.68.70.72
felixs-sdi1	10800	IN	AAAA	2a03:b0c0:3:d0::e34:5001
*.felixs-sdi1	10800	IN	A	138.68.70.72
*.felixs-sdi1	10800	IN	AAAA	2a03:b0c0:3:d0::e34:5001
felixs-sdi2	10800	IN	A	159.223.25.154
felixs-sdi2	10800	IN	AAAA	2a03:b0c0:3:d0::1092:b001
*.felixs-sdi2	10800	IN	A	159.223.25.154
*.felixs-sdi2	10800	IN	AAAA	2a03:b0c0:3:d0::1092:b001

3 User

```
ssh root@felixs-sdi1.alphahorizon.io
adduser pojntfx
usermod -aG sudo pojntfx
su pojntfx
```

4 SSH

```
sudo apt update
sudo apt install -y openssh-server
sudo systemctl enable --now ssh
mkdir -p ~/.ssh
chmod 700 ~/.ssh
curl 'https://github.com/pojntfx.keys' | tee -a ~/.ssh/authorized_keys
chmod 600 ~/.ssh/authorized_keys
exit
```

5 UFW

```
ssh pojntfx@felixs-sdi1.alphahorizon.io
sudo apt update
sudo apt install -y ufw
sudo systemctl enable --now ufw
sudo ufw default deny incoming
sudo ufw default allow outgoing
sudo ufw allow OpenSSH
sudo ufw enable
```

6 APT

```
sudo apt update
sudo apt install -y unattended-upgrades

sudo vi /etc/apt/apt.conf.d/50unattended-upgrades # Now replace/add the following:
Unattended-Upgrade::Origins-Pattern {
    "origin=*";
}
Unattended-Upgrade::Automatic-Reboot "true";
Unattended-Upgrade::Automatic-Reboot-Time "02:00";

sudo dpkg-reconfigure unattended-upgrades # Answer with yes
sudo systemctl enable --now unattended-upgrades
sudo unattended-upgrades --debug # Test the configuration; this will install the available u
sudo reboot # If required
```

7 Traefik

```
$ sudo apt update
$ sudo apt install -y docker.io
$ sudo systemctl enable --now docker
$ sudo mkdir -p /etc/traefik

sudo named-checkconf
sudo systemctl reload named

```

9.3 Exercises

Use the `dig` command to query A/CNAME/MX/NS records from various machines/domains of your choice. Then execute reverse lookups as well.

```

# Get A/AAA records from manager server
$ dig +noall +answer @138.68.70.72 example.pojtinger A
example.pojtinger.      3600    IN      A       138.68.70.72
$ dig +noall +answer @138.68.70.72 example.pojtinger AAAA
example.pojtinger.      3600    IN      AAAA    2a03:b0c0:3:d0::e34:5001

```

```

# Get A/AAAA records from worker server
$ dig +noall +answer @159.223.25.154 example.pojtinger A
example.pojtinger.      3600    IN      A       138.68.70.72
$ dig +noall +answer @159.223.25.154 example.pojtinger AAAA
example.pojtinger.      3600    IN      AAAA    2a03:b0c0:3:d0::e34:5001

```

```

# Get NS record
$ dig +noall +answer @159.223.25.154 example.pojtinger NS
example.pojtinger.      3600    IN      NS      ns1.example.pojtinger.
example.pojtinger.      3600    IN      NS      ns2.example.pojtinger.

```

```

# Get CNAME record
$ dig +noall +answer @159.223.25.154 www.example.pojtinger CNAME
www.example.pojtinger.  3600    IN      CNAME   example.pojtinger.

```

```

# Do IPv4 reverse lookup
$ dig +short @159.223.25.154 -x 138.68.70.72
example.pojtinger.

```

```

# Do IPv6 reverse lookup
$ dig +short @159.223.25.154 -x '2a03:b0c0:3:d0::e34:5001'
example.pojtinger.

```

Enable recursive queries to parent nameservers enabling your name-server to resolve external machines like `www.w3.org` by delegation.

```
# Get AAAA record for felix.pojtinger.com using parent nameservers
$ dig +noall +answer @159.223.25.154 felix.pojtinger.com AAAA
felix.pojtinger.com.      123      IN      CNAME    cname.vercel-dns.com.
```

**Provide a mail exchange record pointing to mx1.hdm-stuttgart.de.
Test this configuration using dig accordingly.**

```
# Get MX record
$ dig +noall +answer @159.223.25.154 example.pojtinger MX
example.pojtinger.      3600     IN      MX       1 fb.mail.gandi.net.
```

10 LDAP

```
sudo apt update
sudo apt install -y slapd ldap-utils certbot
```

```
sudo dpkg-reconfigure slapd # ldap.felixs-sdi1.alphahorizon.io, felixs-sdi1
```

```
curl ldaps://ldap.felixs-sdi1.alphahorizon.io:443 # Test the connection
```

```
socat tcp-listen:8389,fork openssl:ldap.felixs-sdi1.alphahorizon.io:443 # Run this on the laptop
curl ldap://localhost:8389 # Test the proxy's connection
```

```
# Connect in Apache Directory Studio with the following info:
# Hostname: localhost
# Port: 8389
# Bind DN or user: cn=admin,dc=ldap,dc=felixs-sdi1,dc=alphahorizon,dc=io
# Bind password: The password from `sudo dpkg-reconfigure slapd`
```

```
# Connect with ldapwhoami like so:
ldapwhoami -H 'ldaps://ldap.felixs-sdi1.alphahorizon.io:443' -x # Anonymous
ldapwhoami -H 'ldaps://ldap.felixs-sdi1.alphahorizon.io:443' -W -D cn=admin,dc=ldap,dc=felixs-sdi1,dc=alphahorizon,dc=io
```

```
# Now add the objects:
ldapadd -H 'ldaps://ldap.felixs-sdi1.alphahorizon.io:443' -W -D cn=admin,dc=ldap,dc=felixs-sdi1,dc=alphahorizon,dc=io
version: 1
```

```
